BTRFS provides native multi-level snapshot support in the Linux kernel through the `snapshot()` file-system operation. How BTRFS snapshots work A snapshot is a full image of a filesystem that is logically stored at a different point in time. It does not interfere with the running system but works quite independently. You can save it and revert it back to the original state at any time. Snapshots of the filesystem are created in directories with an extension of `.s*`. You can decide to maintain only some of the file system snapshots or create a snapshot of an entire volume. Features BTRFS is an open-source snapshot management system that enables you to backup your data and revert it back to the previous state. The snapshot support in the kernel is implemented through the use of a snapshot tree. BTRFS advantages Cheaper snapshots when compared to LVM BTRFS does not use a separate volume group for its snapshots. The snapshots of the filesystem are integrated into the folder system so there's no need to create virtual devices, volumes, or additional file systems. Single LVM layout supports snapshotting of several file systems If you are using LVM for managing volumes in your Linux system then you can use a single volume group for all file systems. The snapshots of the filesystems will be represented in the filesystem hierarchy as subdirectories. Full support of snapshotting ext4, XFS and ZFS file systems BTRFS supports a variety of file systems including ext4, XFS, ZFS, and ReiserFS. Non-interactive as compared to LVM If you don't want to press F1 each time you need to revert to the previous snapshot then you can manage snapshots through the use of the command line interface. Allows you to create snapshots of the home folder BTRFS makes it possible for users to create a snapshot of the home directory. Every user's home directory is placed in a subdirectory called `.snap`. You can easily restore the system and resume the previous work. If you find that you don't need the files of the home directory anymore, you can easily remove it. BTRFS Pros BTRFS snapshot file sizes are smaller than LVM snapshots As opposed to LVM snapshots, the file sizes of BTRFS snapshots are smaller. The snapshot size depends on the filesystem and the amount of files in the file system
