The Existing Snapshots list in vSphere Home is empty, which means no snapshots exist for the Automatic snapshot generation settings. You will need to select the settings, and create the snapshot (Step 2). When upgrading a vCenter Server or vSphere Server instance to vSphere 7.x, the Compatibility Checks feature is enabled by default. Whenever you upgrade or patch a vCenter Server or vSphere Server, whether to a new version or an updated patch, the Compatibility Checks feature determines if your current configuration meets the compatibility guidelines for the new version. If you perform the upgrade or patch using a new valid license, the Compatibility Checks feature is not required for the upgrade. If you perform the upgrade or patch using an old but valid license, the Compatibility Checks feature determines if your current configuration meets the compatibility guidelines for the new version. For new vSphere installations, Compatibility Checks determines the recommended upgrade strategy for your vSphere environment. You can perform an upgrade or patch by using the new version, or by using an older version. For more information, see Compatibility Checks. You can upgrade your vCenter Server 6.x environment to vSphere 7.x using the VMware Update Manager plug-in. The VMware Update Manager plug-in has been replaced by the

VMware Lifecycle Manager plug-in. You can upgrade your vSphere Server 6.x environment to vSphere 7.x using the VMware Lifecycle Manager plug-in. The VMware Lifecycle Manager plug-in has been replaced by the VMware Update Manager plug-in.

In a vSphere Lab demo, a vCenter Server 6.0 U2 (vCSA 6.0 U2) appliance is installed and linked with a PC. The vCenter Server 6.0 U2 appliance takes care of the vSphere components on the PC. You can see, in the picture, that the vCSA 6.0 U2 appliance links with the PC and then is linked with the vCenter Server appliance in the vSphere 6.0 demo. In this demo, you can see that vCenter Server 6.0 U2 appliance acts as the vSphere appliance, its processes are similar to an ESXi host, and it takes care of the vSphere components on the PC. In a vSphere 6.0 demo, a vCenter Server Appliance 6.0 U2 (vCSA 6.0 U2) appliance is installed, linked, and configured to host and manage the VMs in the same lab as a Dell R710. The Dell PowerEdge R710, which is in the vSphere lab, hosts a number of VMs, including ESXi 6.0, vCenter Server 6.0 U2 (vCSA 6.0 U2), and a vCenter Networking Extension agent. The vCenter Server 6.0 U2 appliance hosts and manages the VMs that are running in the lab. After a shared storage pool is mounted as a local file system, VMs can store their files and associated settings in that file system. You can import VMware vSphere HA settings and configurations from a shared storage pool that is not associated with a VMware vCenter Server appliance by using the vSphere HA CLI. This is due to a change in network types that does not allow for an NSX transport node to have multiple network types. In vSphere 6.0, the NSX transport node was only allowed to be a VDS. In vSphere 7.0, you must specify a physical network or transport type for the transport node. You must also specify the same network type for all of the VMs in the cluster. In addition, this change ensures that VMs will always receive network connectivity as long as they are running on a host that meets the defined criteria. Since some

transport types are not usable as NSX transport types, the DRS functionality for them is disabled.
